Description. Work on the human brainstem has been impeded by the unavailability of a comprehensive diagrammatic and photographic atlas. In the authors' preliminary work on the morphology of the human brainstem (The Human Nervous System, 1990), Paxinos et al demonstrated that it is possible to use chemoarchitecture to establish a number of human homologs in structures known to exist in the rat, the most extensively studied species.

In this work, we develop and publicly distribute a novel probabilistic atlas of 23 brainstem pathways using HCP data of the highest quality with minimal distortion artifacts in the brainstem area . Compared with previous atlases on brainstem pathways, our work has the following novel contributions: First, we conduct extensive quality control on the connectome imaging data of 488 HCP subjects with complete diffusion MRI scans from the HCP-500 release to exclude datasets with significant ...

A present-day atlas of the human brain. Defining brain regions and demarking their spatial extent are important goals in neuroscience. A modern map of the brain's cellular structure, a cytoarchitectonic atlas, should provide maps of areas in three dimensions, integrate recent knowledge about brain parcellation, consider variations between individual brains, rely on reproducible workflows, and ...

The brainstem is a critical structure that regulates vital autonomic functions, houses the cranial nerves and their nuclei, relays motor and sensory information between the brain and spinal cord, and modulates cognition, mood, and emotions.
