Conference: Combating Fake News: An Agenda for Research ...

Fake news purveyors can be enticed away from creating funny satirical content to more believable content because they think it is more likely to be shared. One such story, which was widely shared...

This volume examines the phenomenon of fake news by bringing together leading experts from different fields within psychology and related areas, and explores what has become a prominent feature of public discourse since the first Brexit referendum and the 2016 US election campaign. Dealing with misinformation is important in many areas of daily life, including politics, the marketplace, health communication, journalism, education, and science. In a general climate where facts and misinformation blur, and are intentionally blurred, this book asks what determines whether people accept and share (mis)information, and what can be done to counter misinformation? All three of these aspects need to be understood in the context of online social networks, which have fundamentally changed the way information is produced, consumed, and transmitted. The contributions within this volume summarize the most up-to-date empirical findings, theories, and applications and discuss cutting-edge ideas and future directions of interventions to counter fake news. Also providing guidance on how to handle misinformation in an age of "alternative facts", this is a fascinating and vital reading for students and academics in psychology, communication, and political science and for professionals including policy makers and journalists.

Fake news has found success in campaigns designed to attack the truth and reframe it to fit a specific agenda. As a result, combating fake news and standing up for the truth has become a staple of most mainstream television news outlets over the past three years (from 2016-2019). Fake news is not a new problem. It is modern-day propaganda made up of 21st-century media - tweets, headlines, and viral videos-created and distributed with the sole intent of causing disruption and confusion by selecting the points of interest deemed most favorable to the person or outlet making the claims. However, fake news and its offshoots, misinformation, and disinformation are symptoms of a bigger problem - the overall attack on science-backed truth. The mainstream media's responsibility is to stand up for factual truth, and they must take a more active role in defending the truth despite any notions of bias, politics or public outcry. This thesis will look at the media's role in defending the truth as the public is bombarded with too much information combined with the science of propaganda, which both manipulates the version of the truth the public sees as well as weakens their ability to be critical thinkers.

"This issue of Library Technology Reports is for librarians who serve all age levels and who can help by teaching users both that they need to be aware and how to be aware of fake news. Library instruction in how to avoid fake news, how to identify fake news, and how to stop fake news will be essential."--Abstract.

Fake News: Falsehood, fabrication and fantasy in journalism examines the causes and consequences of the 'fake news' phenomenon now sweeping the world's media and political debates. Drawing on three decades of research and writing on journalism and news media, leading scholar Brian McNair engages with the fake news phenomenon in accessible, insightful language designed to bring clarity and context to a complex and fast-moving debate. McNair presents fake news not as a cultural issue in isolation but rather as arising from, and contributing to, significant political and social trends in twenty-first century societies. Chapters identify the factors which have laid the groundwork for fake news' explosive appearance at this moment in our globalised public sphere. These include the rise of relativism and the crisis of objectivity, the role of digital media platforms in the production and consumption of news, and the growing drive to produce online content which attracts users and generates revenue. The book also considers the decline of trust in journalism, and the how the traditional left critique of 'dominant ideology' and 'ruling elites' in media has been appropriated by the alt-right, nationalists and populists all over the world. This book rejects the left-right division in discussion of what is and is not 'fake news'. Rather, it aims to provide students, teachers, journalists and general readers with the tools necessary to navigate the digital journalism landscape in the era of President Donald Trump, and to filter out the 'fact' from the 'fake' in their news.

Libraries and the Global Retreat of Democracy focuses on how libraries coordinate their work in political and information literacy and how these efforts can be improved, the recommendations and examples within which will serve as inspiration and motivation to its readers.

Over the last few years, social media has expanded to become a key platform for news dissemination and circulation, and a key originator and propogator of 'fake news'.. Nations, governments, organisations and societies are now coming to terms with the unpredictable and

debilitating consequences of fake news. The propagation of news containing falsehoods has been linked to an increase in measles cases, surges in youth crimes, the spread of pseudo-science, compromised national security, and more. Some even perceive it as a global threat to democratic systems around the world. In this book, the authors examine factors influencing the spread of fake news, and suggest ways to combat it by exploring the key elements which enable and facilitate this phenomenon.

"Everyone is entitled to his own opinion, but not to his own facts." —Former Senator Daniel Patrick Moynihan Fake News is a brief non-partisan chapter written by award winning political scientist Donald F. Kettl. Written as a supplement for American Government or Media and Politics courses, this chapter sparks classroom discussion by enabling students to take a deeper look at the phenomenon of "fake news" and to see the impact this issue has had on American politics. Students Save with the Trending Topics series! We've made it easy for students to get Fake News, all in one convenient package at a student-friendly price. When bundled with many of our CQ Press texts, students receive this supplement for FREE. See our full suite of textbook-Fake News bundle offerings at cqpress.com/trendingtopics. Instructors, insert this chapter into your textbook! Contact your Custom Team directly to learn more about your custom teaching solution.

In the past decade, social media has become increasingly popular for news consumption due to its easy access, fast dissemination, and low cost. However, social media also enables the wide propagation of "fake news," i.e., news with intentionally false information. Fake news on social media can have significant negative societal effects. Therefore, fake news detection on social media has recently become an emerging research area that is attracting tremendous attention. This book, from a data mining perspective, introduces the basic concepts and characteristics of fake news across disciplines, reviews representative fake news detection methods in a principled way, and illustrates challenging issues of fake news detection on social media. In particular, we discussed the value of news content and social context, and important extensions to handle early detection, weakly-supervised detection, and explainable detection. The concepts, algorithms, and methods described in this lecture can help harness the power of social media to build effective and intelligent fake news detection systems. This book is an accessible introduction to the study of detecting fake news on social media. It is an essential reading for students, researchers, and practitioners to understand, manage, and excel in this area. This book is supported by additional materials, including lecture slides, the complete set of figures, key references, datasets, tools used in this book, and the source code of representative algorithms.
