PRINCIPLE OF OPERATION In simple a underwater windmill consists of a number of blades mounted on a hub (together known as the rotor), a gearbox, and a generator. The hydrodynamic effect of the flowing water past the blades causes the rotor to rotate, thus turning the generator to which the rotor is connected via a gearbox. The gearbox is used to convert the rotational speed of the rotor shaft to the desired output speed of the generator shaft. The electricity generated is transmitted to land ...

Maintaining marine turbines. The complex challenge of turbine maintenance in the hostile underwater environment is an obstacle to wider tidal energy adoption. Researchers in the UK and elsewhere are modelling turbine behaviour and unstable loads, to improve marine turbine life expectancy and drive innovative new designs. "The best places for tidal power are probably the last places in the world you'd actually choose to stick a generator," says green energy consultant Cerys Watkins.
